

ISBA 4775-01: Networking & Cloud Computing

Loyola Marymount University | Fall 2026

Course	ISBA 4775-01, Networking & Cloud Computing
Credit hours	4
Meets	Tuesday and Thursday, 1:45 PM to 3:25 PM
Location	Hilton 115

Instructor

Instructor	Greg Lontok, Clinical Associate Professor
Office	Hilton 114
Preferred contact	Microsoft Teams message, for the fastest response
Course Teams channel	https://r.isba.co/networking-cloud-teams-fa26
Email	gregory.lontok@lmu.edu
Office hours	By appointment. Book at https://calendly.com/greg-lontok

Course description

This course will introduce students to the fundamentals of networking and cloud computing. Students will configure networks and cloud computing services to address common information systems and business analytics needs through hands-on exercises. The course will start with networking fundamentals covering topics such as networking hardware, the OSI Model, TCP/IP, and various network protocols, while addressing each topic's security considerations. The second half of the course will leverage the student's networking foundation to explore and deploy the most commonly used cloud services, including compute, storage, databases, and serverless. Students will be able to host cloud-based applications and know the difference between the various cloud services available. This course may not be repeated for degree credit.

Prerequisites

ISBA 3710 with a minimum grade of C-.

What this course is for

You already know how to code, and this course is about what happens after that: getting something you built to run somewhere other than your laptop, keeping it running, and being able to explain how it works to someone who asks hard questions.

By the end you should be able to walk into an unfamiliar system and make sense of it.

What you own

You will use AI throughout this course, heavily, and that is expected.

What stays yours is the system. You know how it works, how it talks to other systems, what it is for, and how it delivers value to the stakeholder. It has to be fit for purpose: not only that you can build one, but that it suits the environment and constraints it has to live in.

Two whiteboard interviews, together worth 42.5% of your grade, are where that gets observed. You diagram your own system from memory, with no notes and no repository open, and then answer for it. "Working with AI" below is the full policy.

Learning outcomes

By the end of this course you can:

1. Read an unfamiliar system. Identify its components, dependencies, and boundaries, and ask the questions that reveal purpose, alternatives, cost, and where the pieces are isolated or coupled.
2. Design a system fit for purpose. Select and justify infrastructure against a stakeholder's real environment, constraints, and budget, and defend why that choice differs for a hobby project, a startup, and an enterprise.
3. Build and deploy an application on cloud infrastructure, moving it deliberately through local development, staging, and production.
4. Troubleshoot a system under failure. Form and test hypotheses, isolate the fault along the dependency chain, and describe what went wrong in the language practitioners use.
5. Operate a deployed system responsibly for access, security, performance, and cost, and produce evidence it is working as intended.
6. Explain and defend the system to a stakeholder. What it does, why it was built this way, which alternatives were rejected, where its limits are, and what should happen next.

Grading

Component	Points
Exercises (10 × 15)	150
Project 1, Own Your Corner of the Internet	125
Midterm whiteboard interview	125
Project 2, the job-description-driven build	300
Final whiteboard interview	300
Total	1000

Projects are 42.5% and interviews are 42.5%. This course grades whether you can explain what you built about as heavily as the artifact itself.

Letter grades

Grade	Range		Grade	Range
A	93-100		C+	77-79
A-	90-92		C	73-76
B+	87-89		C-	70-72
B	83-86		D	60-69
B-	80-82		F	below 60

Exercises, 150 points

There are ten exercises, worth 15 points each. Exercise 01 and Exercise 02 are submitted as files through Brightspace. From Exercise 03 on, exercises go in your public `career-platform` repository, as specified in their briefs. Each brief defines its required evidence and grading.

Exercise 02 extends the in-class server lab: independently investigate a stopped Nginx service and a stopped MySQL service, explain your evidence, repair each service, and repeat the failed test. Submit a hand-drawn system diagram as a JPG and a short investigation report as Markdown. The rubric is 8 points for the two investigations, 4 for the diagram and explanation, and 3 for the healthy baseline and verified Codespace shutdown.

Exercise schedule

#	Exercise	Type	Due
01	Accounts, your home network, and the self-discovery interview	Config	Tue 9/8
02	Troubleshoot a cloud service: Nginx and MySQL	Troubleshoot	Tue 9/15
03	Build it, then move it: spec, plan, and migration plan	Build	Thu 10/1
04	Domain delegated to Cloudflare DNS, live with HTTPS	Config	Thu 10/8
05	Broken DNS/TLS: diagnose and fix	Troubleshoot	Thu 10/15
06	Email DNS: Email Routing MX, and SPF, DKIM, and DMARC for Resend	Config	Tue 10/13
07	Job Scout's first loop: tools, state, stop conditions, and a real run	Build	Tue 10/20
08	Broken integration: an expired credential and a changed schema in Job Scout	Troubleshoot	Tue 10/20
09	Raw agent loop in Python, three tools, evals, trace read	Build	Thu 11/5
10	Broken agent: bad tool schema, runaway loop, cost blowup	Troubleshoot	Thu 11/12

Ex01 and Ex02 were due at 1:45 PM, before class, and Ex03 is due at the same time on Thu 10/1. The Railway migration is a Project 1 requirement, taught on Thu 10/8. GA4 is an optional extension.

Project 1: Own Your Corner of the Internet, 125 points

Project 1 runs from week 1 through week 8, and it is **due Thu 10/22**.

The exercises build the pieces. Project 1 is the integrated, documented, portfolio-grade assembly of them.

Deliverable	Requirement
Domain	Purchased, delegated to Cloudflare DNS, zone under your control
Site	Personal site on an Azure VM, then migrated to Railway with managed PostgreSQL, live at your domain with valid TLS
CI/CD	GitHub Actions, push to main deploys
Transactional email	Resend verified on your domain, with SPF, DKIM, and DMARC published and passing
Job Scout	A small agent that retrieves real postings from a reliable source, matches them against your profile, and emails you a digest from your own domain
Architecture diagram	One page, labeled, every service and the data flow between them
README	Configuration guide, an FAQ of at least five questions drawn from real failures, and a retrospective

The question is not whether you completed the steps but whether you would show this repository to an employer.

Your Job Scout must surface at least five real postings you would actually want. You pick one, and it becomes Project 2's brief. If your scout underperforms, there is a vetted feed of postings so you are not blocked.

Midterm whiteboard interview, 125 points

The midterm is twenty minutes, in person and one-on-one, scheduled through Calendly. Slots run **Tue 10/27 through Thu 10/29**, and a study guide is published in advance.

You spend the first fifteen minutes on your own system. You diagram it from memory, with no notes and no repository open, and then you answer for it: why this service, what you rejected, what it costs, how you know it works, what breaks first under load, and what you would do differently.

The last five minutes are a curveball. I change one constraint, drawn from a deck whose categories you have seen but whose specifics you have not. Traffic might increase tenfold, the budget might be cut by eighty percent, or a vendor might sunset a service you depend on. You redesign on the spot.

Most students have never done a whiteboard interview. The October one is where you find out what that is like while it still costs 125 points instead of 300, and that is why it sits before the November 13 withdrawal deadline.

Project 2: the job-description-driven build, 300 points

Project 2 runs from week 10 through week 15. You pick one posting your Job Scout surfaced, read the system that job implies, and build it. The architecture is fixed, and the job description chooses the problem domain.

Deliverable	Requirement
Web app	On a subdomain of the domain you already own
Agent	Custom-built: tools, memory, structured outputs, guardrails, embedded as an endpoint
Grounding	Domain data in S3, reached with least-privilege IAM credentials

Deliverable	Requirement
Orchestration	A layer connecting two systems on a trigger, doing real work in the job's domain
Environments	Local, staging, production, with promotion through CI/CD
CI/CD	GitHub Actions, secrets managed properly, deploy on merge
Operations	Auth, rate limiting, analytics, cost controls, a monitoring story
Evidence	An eval set for the agent and an inspectable trace
Decision record	Your most important decision, the evidence, how AI contributed, what you accepted or rejected or changed, how you validated it, your biggest remaining uncertainty, and what is next
Blog post	The writeup

Everyone builds the same skeleton onto a different problem. A logistics posting might yield a shipment-status copilot, a marketing posting a campaign analyzer, and a healthcare-operations posting an intake triage assistant.

The orchestration requirement is a capability, not a tool. n8n, Make, Zapier, Power Automate, and code all count.

Your system has to be both deterministic and agentic, and you have to defend where the line between them falls. Knowing which parts should be a fixed workflow and which should be agentic is a design judgment, and it is the obvious curveball: your API costs tripled, so what moves out of the agent?

Milestones

These are gates inside the Project 2 grade rather than separate line items.

Milestone	Bar	Due
M1	Posting selected, PRD written, architecture diagram approved	Tue 11/10
M2	App scaffolded and deployed to production on your subdomain	Tue 11/17
M3	Agent responding with tools, grounded in domain data via S3 and IAM	Tue 11/24
M4	Orchestration integrated, staging environment live and promoting to production	Thu 12/3
Final	Full system, operations hardened, evals, decision record, blog post	Tue 12/8

M4 fails without a working staging environment. The application runs fine without one, which makes it the first thing skipped under deadline pressure.

Final whiteboard interview, 300 points

Thursday, December 17, 11:00 AM, in the scheduled exam slot, for thirty minutes.

Same format as the midterm: twenty-five minutes on your own system from memory, five minutes of curveball. The system you defend is the one you built for a job you chose, so this is a simulated interview for that job.

Semester at a glance

Weeks	What happens
1-8	Networking foundations, then the cloud arc. Exercises 01-08, Project 1
9	Midterm whiteboard interviews
10-15	Project 2, the job-description-driven build. Exercises 09-10, milestones M1-M4
Finals	Final whiteboard interview

Thanksgiving week meets once, on Zoom. Tuesday, November 24 is remote, and you join from the Zoom tool in Brightspace rather than coming to Hilton 115. Thursday, November 26 is Thanksgiving Day, and it is the only cancelled meeting all semester.

Labor Day and Autumn Day fall on days this course doesn't meet.

Key dates

Event	Date
Add/drop without a W	Fri Sep 4
Project 1 due	Thu 10/22
Midterm interviews	Tue 10/27 to Thu 10/29
Last day to withdraw	Fri Nov 13
Instruction ends	Fri Dec 11
Final interview	Thu Dec 17, 11:00 AM

Class schedule

Date	Session	Before class	Due
Tue 9/1	The map: where a request goes, and the devices it passes through		
Thu 9/3	Finding things: host names, IP and MAC addresses, the default gateway, DNS, and what your own machine will tell you		
Tue 9/8	Ports and web services: requests, responses, HTTP status codes, and investigating a service failure		Ex01
Thu 9/10	Running and Troubleshooting Services: physical server, VM, container; Nginx and MySQL; processes, ports, logs; database creation, tables, and sample data		
Tue 9/15	Database to application: portfolio from a template, repeatable setup, Python build-along, environment variables and Codespaces secrets, failure/recovery, commit/push and a small change; optional instructor PaaS demo		Ex02

Date	Session	Before class	Due
Thu 9/17	Building with an agent and Git: executing the implementation plan, the request path through Nginx, the app server, and SQLite, and clone, add, commit, push, and pull		
Tue 9/22	Migrating to a VM: feature branches and pull requests, what Git moves and what it doesn't, IaaS, PaaS, and SaaS, and Azure resource groups		
Thu 9/24	Creating the VM: SSH keys, an Azure VM, a cloud firewall rule for SSH, and a written migration plan		
Tue 9/29	Finishing the migration: rebuilding the environment, moving live SQLite data, and verifying the app on the VM		
Thu 10/1	Operating the VM: Gunicorn and systemd, Nginx as a reverse proxy, recovering after a restart, and delegating your domain to Cloudflare DNS	Register your domain with the domain guide , a free .me or a \$6.79 .com. Create a free Cloudflare account .	Ex03
Tue 10/6	DNS for the web and for email: HTTPS for your domain, inbound mail through Email Routing and MX, and SPF, DKIM, and DMARC for a Resend sender	Run <code>dig NS yourdomain</code> and confirm that Cloudflare's name servers come back. Create a Resend account .	
Thu 10/8	Migrating to a PaaS: PostgreSQL on Railway, comparing source and target data, cutting the domain over, and who manages what	Between 10/3 and 10/7, sign in to Railway with GitHub and check your trial . Create nothing yet. The 30-day trial starts when you sign in.	Ex04
Tue 10/13	Designing an agent: model, tools, state, and loop, drawing Job Scout's graph, and calling a job-posting API	Set up Claude API access with the setup guide , which costs about \$5. Find your Ex01 self-discovery interview , and list ten companies near you that you'd like to work for.	Ex06
Thu 10/15	Building the agent: stop conditions, a human checkpoint on the top three postings, the email digest, and a controlled failure	Confirm that Resend's domains page shows your domain as verified.	Ex05
Tue 10/20	CI/CD with GitHub Actions, a submission audit, and practice interviews in pairs	Draw your whole system from memory once, on paper.	Ex07, Ex08
Thu 10/22	Project 1 walkthroughs, the midterm study guide, and what a whiteboard interview is		Project 1
Tue 10/27	Midterm whiteboard interviews, no class session		
Thu 10/29	LLM calls: tokens, context windows, cost, and structured outputs		
Tue 11/3	The agent loop: tools, schemas, memory, and reading a trace		
Thu 11/5	Eval: what to measure, building a small eval set, and finding why a run failed		Ex09
Tue 11/10	Reading a job description as a system spec, and architecture review one by one		M1

Date	Session	Before class	Due
Thu 11/12	Guardrails: loop limits, schema validation, token budgets, and cost controls		Ex10
Tue 11/17	Environments: local, staging, production, and promotion through CI/CD		M2
Thu 11/19	Cloud storage and databases: object versus relational, S3, and least-privilege IAM		
Tue 11/24	Grounding review, retrieval, chunking, and what the agent must not see. On Zoom		M3
Thu 11/26	No class, Thanksgiving		
Tue 12/1	Operating a deployed system: auth, rate limiting, monitoring, and cost controls		
Thu 12/3	Staging in practice, then the decision record		M4
Tue 12/8	Blog post workshop and final interview prep		Project 2
Thu 12/10	Final interview practice in pairs, and a course retrospective		

September 15 continued the unfinished application build from September 10. September 17 went to building the application and to Git, so the Azure migration moved to September 22 and the sessions after it moved back one meeting. The migration then took two meetings, September 22 and 24, so finishing it moved to September 29 and Operating the VM moved to October 1. On September 29, the rest of October was re-sequenced to fit the Project 1 deadline. The domain moved from Route 53 to Cloudflare DNS, and the PaaS migration moved from Heroku to Railway, because neither needs a card or an approval wait to start. Diagnosing the request path now happens inside the HTTPS lesson, and Job Scout is built as an agent across two meetings. The Before class column lists what to set up ahead of each meeting, so class time goes to the work rather than to account sign-ups. Ex04 through Ex08 moved with the lessons, so Ex06 is now due 10/13 and Ex07 is due 10/20.

Work load expectations

LMU follows the Carnegie Unit standard: one semester credit hour represents at least three hours of student engagement per week. See <https://academics.lmu.edu/aprc/lmucredithourpolicy/>

For this four-credit course that is an average of **12 hours per week** across the semester, including class meetings, exercises, project work, and preparation.

Expect this to be uneven. Weeks with a troubleshooting exercise and weeks around a Project 2 milestone run heavier than the middle of a build.

Required materials

There is no textbook. This course runs on real infrastructure, which costs real money, and most of the spending starts in Exercise 01.

What	Cost	When
Claude Pro or an accepted ChatGPT subscription	Claude Pro is \$20/month on monthly billing; alternative plan pricing varies	Choose one in Ex01; follow the relevant assignment for coding-agent setup
Railway	The 30-day trial includes a one-time \$5 credit and needs no card. After it ends, the Free plan's \$1 a month may not keep your site running	Sign in between 10/3 and 10/7 for the Thu 10/8 migration
Domain name	Free for a year through the GitHub Student Developer Pack, otherwise \$10 to \$15	Before Thu 10/1, and it stays yours after the course
Cloudflare DNS	Free	Before Thu 10/1
GitHub	Free tier	Exercise 01
GitHub Codespaces	Personal-account compute/storage allowance; additional usage can cost money	Course Codespace in Session 04 for Ex02; new portfolio Codespace in Session 05
AWS	Free tier	Project 2, after the midterm
Resend and Cloudflare Email Routing	Free tier	Tue 10/6
Google Cloud and Firecrawl	Free tier	Exercise 07

Plan your budget around the AI subscription you choose, domain registration, and the services you actually run. Prices, credits, and eligibility can change. Check [Claude pricing](#), [Railway plans](#), and [Codespaces billing](#) before enabling paid usage. A free tier does not mean all usage is free.

Apply for the [GitHub Student Developer Pack](#) in week 1 and check the current offers and verification status in your account. Do not plan on a particular benefit until you have confirmed eligibility.

For the Codespaces lab, check your allowance with the instructor, keep forwarded ports private, and stop the environment when finished. Contact me if access is blocked or a billing change is requested. Bring cost questions to me early.

Required lab fees

None.

Instructional methods

We meet in person twice a week, and each session combines instruction, live work, and student walkthroughs of their own exercises. Guided setup and build-alongs include predictions, live troubleshooting, and brief discussion. Detailed incident reports and diagrams are completed independently in the assigned homework. There are also two one-on-one whiteboard interviews.

Assignments and feedback

Follow each assignment's submission instructions. Ex01 and Ex02 go to Brightspace as separate files. Later builds use repositories and live systems as specified in their briefs; projects include their repositories and deployed systems. Due dates are announced in Brightspace and reflected in this syllabus. A date marked proposed or to be announced is not a confirmed deadline.

For Ex02, Google Docs saves your report automatically. Confirm it is saved to Drive, stop the Codespace, add your shutdown note, and download the report as Markdown for submission. Your diagram is a separate JPG. The Codespace should be stopped after testing; it does not need to remain running for grading.

Feedback is given in class, in Brightspace, or in the repository, depending on the assignment. Interview feedback is given verbally at the end of the interview.

Deadlines are hard. Late work loses 10% per day, down to a floor of 50%. A late assignment is worth less, but it's never worth nothing, so finish it and turn it in.

If you know you're going to miss a deadline, send me a Teams message before it passes. I may move it. That's case by case, and there's no bank of late days to spend. If I move a deadline, the new date is the deadline, and the 10% per day runs from there. No message before the deadline means no conversation after it, and the 10% per day runs from the original date.

Some assignments are delivered in person at a fixed time, and the meeting time is the deadline. The two whiteboard interviews can't be rescheduled, so missing one scores zero on it.

Emergencies sit outside all of this. Tell me when you're able and we'll make a plan.

Attendance

Your scheduled commitments are class sessions, your midterm interview slot, and the final interview.

If you feel ill, stay home. Rest, and keep everyone else healthy.

When you can't make one, send me a Teams message. Beforehand is best, and as soon as you can if something happens that morning. Late still beats silent.

Your first three absences cost you nothing if you told me. You don't owe me a reason and I won't ask for documentation.

An absence you never tell me about costs 2% of your total grade, and it still uses up one of the three. From the fourth on, each absence costs 2% whether you told me or not. That 2% comes off your final grade after everything else is totaled, so attendance is not a line in the grading table.

Emergencies sit outside all of this. Serious illness, hospitalization, a death in the family: the three-absence count doesn't apply. Tell me when you're able and we'll work out a plan for the rest of the term.

Use of technology

We introduce tools when the relevant lesson or assignment needs them. In Session 04, students create a Codespace directly from the course repository. They install services and create a MySQL database with sample data.

In Session 05, students create their own public portfolio from the [instructor template](#). They add a Codespaces secret and open a new Codespace from their portfolio. GitHub clones that repository automatically. Setup scripts and SQL recreate the services and data inside its Linux container.

The coding agent interviews students, then helps build a Python application after plan approval. Students verify database reads, failure, and recovery. They commit and push a working version, then make and verify a small change before committing and pushing again. An optional instructor Railway demo connects this workflow to deployment. Student deployment instructions follow with the personal-site work.

The early server lab does not require a local editor, database, or coding-agent installation. The Ex03 brief will specify any local workflow setup. Cloudflare, Railway, Resend, AWS, and orchestration tools are introduced with the lessons that use them. The class schedule's Before class column lists what to set up ahead of each meeting.

See "Working with AI" below for how AI use is expected and assessed here.

For technology assistance, contact the ITS Service Desk:

- Phone: 310-338-7777 or 213-736-1097
- Email: servicedesk@lmu.edu
- Self-service: <https://its.lmu.edu/servicedesk>

Working with AI

Use AI for everything it is good at: planning, writing code, debugging, reading unfamiliar documentation, explaining errors, and drafting your PRDs.

There is no restriction on how much you use it and no requirement to log prompts.

What matters is what remains yours:

- You defend the system. An AI can build a system you cannot explain. The whiteboard interviews find that out.
- You validate your own work. Live systems, evals, traces, and an honest account of what you have not verified.
- You own the decisions. Which service, which alternative you rejected, where the deterministic/agentive line falls, and why. If AI recommended something and you took it, you should be able to say why it was right.
- You own what you ship, including its limits and what you would do next.

Independent work is not the same as independent thinking. You can use AI heavily and demonstrate excellent ownership. You can also work entirely alone and demonstrate very little.

Student support

- Academic Resource Center: <https://academics.lmu.edu/arc/>
- Student Psychological Services: <https://studentaffairs.lmu.edu/wellness/studentpsychologicalservices/>
- Disability Support Services: <https://academics.lmu.edu/dss/>
- Community of Care: <https://studentaffairs.lmu.edu/lmucare/>

If something outside this course is affecting your ability to do the work, tell me.

University policies

Academic honesty

Loyola Marymount University is a community dedicated to academic excellence, student-centered education, and the Jesuit and Marymount traditions. As such, the University expects all members of its community to act with honesty and integrity at all times, especially in their academic work. Academic honesty requires that all members of the LMU community act with integrity, respect their own intellectual and creative work as well as that of others, acknowledge sources consistently and completely, act honestly during exams and on assignments, and report results accurately. As an LMU Lion, by the Lion's Code, you are pledged to join the discourse of the academy with honesty of voice and integrity of scholarship.

Academic dishonesty will be treated as an extremely serious matter, with serious consequences that can range from receiving no credit for assignments/tests to expulsion. It is never permissible to turn in any work that has been copied from another student or copied from a source (including Internet) without properly acknowledging/citing the source. It is never permissible to work on an assignment, exam, quiz or any project with another person unless your instructor has indicated so in the written instructions/guidelines. It is your responsibility to make sure that your work meets the standard of academic honesty set forth in the "Academic Honesty Policy" found at: <https://academics.lmu.edu/honesty/> For an additional resource, see and the "LMU Honor Code and Process" found at: https://bulletin.lmu.edu/content.php?catoid=1&navoid=18#LMU_Honor_Code_and_Process

What this means in this course

AI use is expected and encouraged here, on the terms in "Working with AI" above. Submitting a system you cannot account for is a violation regardless of what produced it.

Two more violations are specific to this course. The first is presenting a system as working without evidence that it works. Report actual observations, including failed checks and unresolved problems; do not fabricate output. Evidence may be a private report, a repository, or a live demonstration, as specified in the assignment. The second is presenting someone else's system, drawing, or evidence as your own. You must be able to explain what you submit.

Special accommodations

The DSS Office offers resources to enable students with physical, learning, ADD/ADHD, psychiatric disabilities and those on the autism spectrum to achieve maximum independence while pursuing their educational goals. Staff specialists interact with all areas of the University to eliminate physical and attitudinal barriers. Students must provide documentation for their disability from an appropriate licensed professional. Services are offered to students who have established disabilities under state and federal laws. We also advise students, faculty and staff regarding disability issues. Students who need reasonable modifications, special assistance, academic accommodations or housing accommodations should direct their request to the DSS Office as soon as possible. All discussions will remain confidential. The DSS Office is located on the 2nd floor of Daum Hall and may be reached by email at dsslmu@lmu.edu or phone at (310) 338-4216. Please visit <http://www.lmu.edu/dss> for additional information.

The whiteboard interviews can be accommodated. The earlier I know, the better I can plan them.

Tentative nature of the syllabus

This syllabus and its contents are subject to revision; students are responsible for any changes or modifications announced or distributed in class or posted on LMU's course management system.

Exercise scope and dates may shift as the semester develops. Any revision will be announced in class and through Brightspace, the same channels through which this syllabus was distributed. The version at <https://r.isba.co/networking-cloud-syllabus-fa26> is always current, and its revision history is visible in git.

Classroom conduct and communication

Treat your classmates with professional respect, particularly when walking through each other's work. Much of this course involves showing something broken in front of the room, which only works if that is a safe thing to do.

Check your lion.lmu.edu email and Microsoft Teams regularly. Those are the channels I use and you are responsible for what is sent through them.

LMU's expectations for classroom behavior are at <https://lmu.box.com/s/v2x89uspgbx3l23egcz7mjd6dbekcn60>

Reporting requirements for sexual or interpersonal misconduct: <https://studentaffairs.lmu.edu/lmucares/>

Emergency preparedness information: <https://www.lmu.edu/emergency>

College of Business Administration mission

We advance knowledge and develop business leaders with moral courage and creative confidence to be a force for good in the global community.
